INDEX ....................................................................................................... 27
The Model SS4-A and SS4-A2 (SS4-A/-A2) Optical Fire Detectors have been manufactured in compliance with the requirements of the ISO-9002 standard and have received:

- California State Fire Marshal (CSFM)
- Factory Mutual (FM)
- Canadian Standards (CSA)
- CENELEC approval by FM Approvals Ltd. Certification Service in compliance with the ATEX Directive.
- CE approval in compliance with the EMC Regulations.
SECTION 1: TECHNICAL DESCRIPTION

1.1 Features and Specifications

1.1.1 General Description

The Model SS4-A/-A2 Optical Fire/Flame Detectors are fast-reacting (within 5 seconds), digital, configurable, computerized, “smart” units. This Detector has sensitivity to Type A, B, and C flaming fires. Detectors of this design process Ultraviolet (UV), Wide band Infrared (IR), and Visible (VIS) spectral ranges from ruggedized Solar-blind UV, “Quantum-Effect” IR, and visible sensors correspondingly. They are equipped with SRL-BIT (Built-In-Test) for optical “through the lens” of both the sensors and lens. The Model SS4-A/-A2 UV, IR, and VIS Fire Detectors have false alarm immunity, and adjustable alarm range between 15 and 60 feet for a one square foot gasoline pan fire with a 120-degree (± 60 degrees from the axis) conical field of view. Their microprocessor-based algorithms (FirePic™, SnapShot™, and Tri-Mode Plot™) assure time programmable alarm verification, Fire Signature Analysis, and compatibility with standard approved fire alarm panels.

The Detector also has the flexibility to be re-configured in the field. Its installation is simple, and operation straightforward due to the built-in self-testing feature. Therefore, the maintenance consists mainly in keeping the Detector window lens clean and performing periodic testing required by the manufacturer of the Fire Control and Suppression System.

Other Specifications:

Housing: Explosion-Proof, Copper-free Aluminum (< 0.4%) with powder coated finish, or optional 316 Stainless Steel, NEMA type 3 and type 4 weatherproof, tamper-resistant with integral dual ¾ inch NPT conduit openings.

Marking: Class I, Div. 1 & 2, Groups B,C, & D
Class II, Div. 1 & 2, Groups E, F, & G
Class III

Class I Zone 1 AEx d IIC
Ex d IIC; Ex tb IIIC

Temperature: Operation: -40 to +80°C (-40 to +176°F)
Storage: -55 to 105°C
Humidity range: 10% to 90% (RH), non-condensing

NOTE: The supply connection wiring shall be rated at least 10°C above the rated service temperature (95°C for T4 applications and 85°C for T5 applications). See Figures 8 and 9 on Page 17 of this Instruction Manual.
**Weight:** Aluminum housing is approximately 3.8 lbs.

Stainless Steel is approximately 8.9 lbs.

**Dimensions:** 4.81 inches diameter by 4.40 inches high

**LED Visual Indicators:**

- **Powered Detector:** Dual LEDs blink every 10 seconds
- **Fault Declared:** One LED turns ON solid until the fault is cured
- **Re-calibrate when:** Both LEDs flash ON and OFF rapidly
- **Fire Declared:** Both LEDs ON solid (one LED blinks during first few seconds) and unlatches after the fire threat is eliminated.

**Electrical Power Requirements:**

- **Connectors:** WECO type screw connectors,
  Wire: 18 to 24 AWG
- **Input Voltage range:** 24 Volts DC nominal, 20.5 to 32 Volts DC
- **Normal Operation Current:** 68 mA nominal (72 with optional MA420-4 Module)
- **Fire Alarm Current:** 75 mA nominal (95 with optional MA420-4 Module)
- **Analog Current Output:** 4 or 20 mA with optional MA420-4 Module.

**Relay Contact:**

- **Rating:** 0.5 Amp at 120 Volt AC or 1 A at 24 V DC resistive
- **Fire relay:** N.O. and N.C. contacts (Latching/Non-Latching, switch selected)
- **Verification relay:** N.O. and N.C. contacts (Adjustable time from 0 to 30 seconds)
- **Fault relay:** N.O. and N.C. contacts
1.1.2 Applications

Applications of the Model SS4-A/-A2 Detectors include warehouses, aircraft hangars, petrochemical facilities, Silane gas storage, Gas turbines, and Power plants, among others.

1.1.3 Detector Locations

For unobstructed performance, considering Detector locations in application areas, avoid sources, other than fire, which may cause false alarms, such as operations utilizing welding or gas torch equipment, high power sources of EMI or RFI, or artificial lighting pointed directly at the Detector. Locations experiencing strong mechanical or acoustical vibrations should also be avoided. For optimum performance, locate the Detector(s) as close as possible to the potential fire source, preferably, along the axis of the vision cone. Install enough Detectors to completely eclipse the fire hazardous area. Assure accessibility for the Detector lens cleaning, as well as best possible protection and/or cleaning from fog, rain, ice, dust, hazardous atmospheres, and other adverse elements. If necessary, utilize the Steel Swivel Mount (Model SM2) or 316 Stainless Steel Swivel Mount (Model SM4) for greater flexibility in mounting locations (See Figures 4 and 5).

1.2 Stand-Alone Operation

For Stand-Alone operation, the Model SS4-A/-A2 Detector may be connected to a FM Approved or UL listed Fire/Security Panel. The Detector operated in the Stand-Alone mode uses the Fire, Fault, and Verify (optional) relays to interface to the Fire/Security Panels. For Stand-Alone operation, the Detector's Fault relay is automatically configured by the on-board microprocessor. The input current of the Model SS4-A/-A2 Detector is about 15 mA higher in the Stand-Alone mode compared to FS2000 System operation.

NOTE: The Fault relay is not available when the Detector is wired to the FS2000 System.

1.3 FS2000 System Operation

For FS2000 System operation, the Detector Fire and Fault signals are sent digitally to the FS2000 System Controller using the four wire FS2000 FireBus. The FireBus provides the 24 volts DC power for the Detector and RS-485 digital communication (Refer to Honeywell Analytics document MN0003 entitled "FS2000 FIRE EARLY WARNING SYSTEM - INSTALLATION and OPERATIONS GUIDE"). For special remote alarm applications, users may also connect directly to the Detector's Fire alarm relay.

NOTE: When the Model SS4-A/-A2 Detector is connected to the FS2000 System using FireBus communication, the Controller automatically disables the Detector's Fault relay.
1.4 Overview

1.4.1 Model SS4-A/-A2 Detector

Version SS4-A: There are two (2) LEDs on the Model SS4-A Detector that indicate the state of the Detector. During normal operation both LEDs will blink every 10 seconds.

If the Detector alarms to a fire, it energizes the Fire relay and turns on both LEDs in the following sequence. One LED is turned on immediately and the second LED will rapidly blink for several seconds indicating that the Detector's FirePic spectra is being permanently stored in the Detector's solid-state memory (FirePic is the several seconds of Detector spectral data which precedes an alarm event). Once the FirePic data is stored, the second LED will remain on. For this version, the fire alarm LEDs turn on and remain on until power to the unit is cycled (turned off and on again).

If the Detector has a Fault, it de-energizes the Fault relay and turns one (1) LED on (the LED will not light if the Fault is a "No Power Fault"). If the Fault condition, such as a "Low Voltage Fault", is eliminated the Detector will automatically return to Normal Operation.

NOTE: Faults caused by excessive input voltage or due to temperatures outside the operating temperature range require factory re-certification. Re-certification is required if a Fault is indicated by both LEDs rapidly blinking (with frequency about 2 Hz.).

Version SS4-A2: The operation of this unit is identical to the SS4-A, except the fire alarm LEDs turn off once the fire threat is eliminated, without power cycling of the device.

1.4.2 Detection Range and Field-of View

The SS4-A/-A2 detection range is field adjustable between 15 and 60 feet in 15 feet increments to an industrial standard of one square foot Gasoline, Kerosene, or isopropyl Alcohol pan fire within 5 seconds.

The Detector is also optimized for the following specific type of fuels and will alarm to the resultant fire within five (5) seconds. Careful attention should be given to the Detector sensitivity setting for these types of fires.

- **Silane Gas**: 10" (10-inch) fire height using a 3/16" orifice at a 15-foot distance, with the Detector sensitivity setting of **15 feet**.
- **Propane Gas**: 10" (10-inch) fire height using a 3/8" orifice at a 15-foot distance, with the Detector sensitivity setting of **15 feet**.
- **Jet fuel-A**: ONE square foot pan fire at a 60-foot distance, with the Detector sensitivity setting of **60 feet**.
- **JP-5**: ONE square foot pan fire at a 60-foot distance, with the Detector sensitivity setting of **60 feet**.
- **JP-4**: TWO square foot pan fire at a 100-foot distance, with the Detector sensitivity setting of 60 feet.

- **JP-8**: TWO square foot pan fire at a 100-foot distance, with the Detector sensitivity setting of 60 feet.

The Detector incorporates a 120-degree conical Field of View. The fire emissions received by the Detector diminish at extreme range and edges of the field-of-view. It is recommended that the Detector be pointed at the fire threat area for the fastest response times to the smallest size fire. When multiple Detectors are used to cover large areas, the Field-of-Views should overlap to insure complete coverage of the fire threat area. The Field-of-View is not, however, limited to 120 degrees. Larger fires outside the 120 degree Field-of-View may cause the SS4-A/-A2 to alarm. This is based on the Inversed Square Law for radiated energy, a larger size fire outside the Detection Range and field-of-view may cause the Detector to alarm. Refer to Figure 1.
1.5 Configuration Settings

The SS4-A/-A2 Detector may be reconfigured in the field and thus optimized for special applications. The configuration of the Detector is set using DIP switches located on the middle circuit board of the Detector Module. The DIP switch settings for each configuration are listed in Table 2.

These configurable options include:

1. **Fire Verify Relay** - The Verify Relay may be disabled or enabled with several Verify Time settings. It also may be set to act as another Fire Relay. The Verify Time may be set from 5 to 30 seconds in 5 seconds increments. **The Factory setting: Verify Relay Disabled.**

   When the Verify Relay is enabled and Verify Time is set the Verify Relay will energize and the Fire Relay will de-energize if the fire conditions are still present at the end of the Verify Time period. In the opposite case, the Detector will wait for 5 seconds plus another Verify Time period to test for the fire conditions. This wait and verify cycle will repeat 10 times, or until the presence of the fire is confirmed. This concludes the verification process. If the presence of the fire is not established the Fire Relay will remain energized unless Non-Latching mode is set. In case a subsequent fire is detected the entire verification process will be repeated. The state of the Fire and Verify Relay after the verification process will depend on the choice between Latching and Non-Latching modes.

   **NOTE:** When the Verify Relay is enabled and Verify Time is set, the Fire Relay will de-energize when the Verify Relay is energized.

2. **Latching / Non-Latching** - The Fire Relay and Verify Relay may be set in a Latching or Non-Latching mode.

   If Latching mode is selected on the SS4-A, the Fire or Verify Relay and red LEDs will remain energized until the Detector power is cycled (power is turned off then on). If Latching mode is selected on the SS4-A2, the Fire or Verify Relay will remain energized until the Detector power is cycled (power is turned off then on), but the red LEDs will reset once the fire threat is eliminated. **The Factory setting is Latching.**

   If Non-Latching mode is selected the Fire Relay and red LEDs will reset after 10 seconds. Non-Latching mode may not meet some Fire Codes. Consult with authority having jurisdiction over the area of application before using this setting.

3. **Test Period** - This setting pertains to the Through-the-Lens test period, which may be set to 6 or to 30 minutes. **The Factory setting is 30 minutes.** The 6-minute period may be required in applications where the lens is frequently obscured.
4. **IR-Only Enable / Disable** - The IR-only setting allows the Detector to declare a Fire on events where UV is not present or is obscured. In applications where UV absorbing fumes are commonly present in high concentrations (these fumes are usually toxic and should require masks or breathing equipment), the Detector will function. **The Factory setting for IR-Only is Disabled.**

**WARNING:** IR-only setting should be used only in special indoor applications.

5. **Fire Detection Range Setting** - 15, 30, 45, or 60 feet. **The Factory setting is 45 feet.** This setting should be changed only if the Detector is located too close to the fire threat area and in the presence of abnormally high UV.

### 1.6 Testing

1.6.1 **Special Conditions for Testing**

The SS4 Detector should be tested immediately after installation, after repair or maintenance involving wiring or module replacement, after periodic maintenance, or after lens contamination has been identified.

1.6.2 **Automatic Testing**

Automatic SLR-BIT (Built In Test) “through-the-lens” self-testing is performed for virtually all-internal electronic systems of the Detector every 10 minutes during its operation. The Detector’s red LEDs blinking 3 times in rapid succession indicates window lens contamination, or lack of the protective grill or enclosure cover.

1.6.3 **Manual Testing**

For manual testing, the SS4-AUV Detector may be exposed to an actual industry standard open flame or to a Test Lamp simulating a fire. It is mandatory to use the Honeywell Analytics handheld UV/IR Test Lamp Model No FT-2045 or FT-2145 with SS4 Fire Detectors. The FT-2045 and FT-2145 Test Lamps are housed in an Explosion-Proof enclosure, powered by internal rechargeable batteries, and designed for indoor and outdoor use. For additional information on the Test Lamps, refer to Honeywell Analytics (FSC) Specification SP0242 for FT-2045 or 1505-008A for FT-2145.

**NOTE:** Other manufacturers UV/IR Test Lamps should not be utilized to test FSC Detectors, conversely, the FT-2045 and FT-2145 Test Lamps should not be utilized for testing other manufacturer’s Detectors.
SECTION 2: INSTALLATION

2.1 Installation Instructions

This section describes the installation of the Model SS4-A/-A2 Detector for the Stand-Alone relay mode. It is recommended that junction boxes be used to wire the Detectors. Determine the configuration settings for the device(s) and the number of connections to be used (Fire, Fire Verify, Fault, and Power) depending on the desired Detection Range and the Fire Control Panel type used (refer to the Fire Control Panel Manual for details).

2.1.1 Installation Precautions

The following precautions should be observed during installation of Model SS4-A/-A2 Detectors.

1. Make sure that the external electrical power is turned OFF before connecting the Detector.

2. Printed circuit board components of the Detector are susceptible to damage from electrostatic discharge. Do not handle the Detector's module (and its printed circuit boards) without adequate grounding and observing all necessary measures to prevent the effect of electrostatic discharge (ESD).

2.1.2 Conduit Installation

When planning the conduit, follow these recommendations.

1. If only one of the two 3/4 inch NPT conduit openings on the Model SS4-A/-A2 Detector enclosure is used, seal the unused opening with a threaded plug and approved sealing material.

2. In areas where moisture may accumulate, install an approved conduit trap or drain.

3. A seal should be installed at the enclosure wall for all applications requiring a Class I, Div. 1 Explosion-Proof rating.

2.1.3 Wiring Recommendations

To prevent intermittent connections, Honeywell Analytics recommends using junction boxes. Install a junction box near each Detector location. Wire each Detector to its junction box. Use screw-down terminal strips inside the junction box to make the connections from the Detector's terminals to an FM Approved or UL listed Fire Alarm Panel. Also use FM/UL Approved junction boxes and terminal strips.

NOTE: Avoid wire splices. However, if wire splices are necessary, all splices should be soldered. Utilization of good wiring practices will simplify installation, improve reliability, and facilitate maintenance.
2.1.4 Power Supply Considerations

The Model SS4-A/-A2 Detector uses 24 Volts DC at a maximum current of 75 mA (with the 4-20 mA option the maximum supply current is 95 mA). Make sure the Panel's power supply can withstand the load current of the total number of Detectors connected to it. For example, if 10 (ten) Model SS4-A/-A2 Detectors are connected to a single Panel's power supply (multiplying 75 mA by 10), the power supply must be able to withstand at least 750 mA + 10% (0.75 A + 10%). This load current must also be taken in consideration for calculating the Panel's 24-hour power backup requirements.

2.2 Installation Procedure

2.2.1 Configuring and Wiring Detectors

To configure and wire a Model SS4-A/-A2 Detector, or to replace the Detector module, the module must be removed from the enclosure. After the wiring; configuration settings and wiring connections have been completed, the module should soon be re-installed in the enclosure to avoid contamination from the environment.

NOTE: Avoid touching the Detector sensors at the front of the Detector module. If touched accidentally, they should be cleaned per instructions of Section 3.2.

2.2.2 Removing Detector From Its Enclosure.

a. With electrical power off (verify that electrical power is off by making sure that the Detector's LEDs do not blink for at least 15 seconds), loosen the Allen-head screw at the base of the metal enclosure top lens cover.

b. Remove the cover and set it aside along with the "O" ring avoiding contamination.

c. Loosen the three Philips head captive screws located on the top circuit board.

d. Carefully lift out the module, sliding it along the three metal standoffs.

2.2.3 Configuring the Detector Module.

Set the DIP switches located on the center PC board of the Detector module to desired settings. Refer to Section 1.5 and Table 2 for DIP switch settings.
2.2.4 Wiring the Detector Module.

a. Insert the cables into the metal enclosure base through one of the conduit openings. Refer to Figure 6.

b. Connect the 24 Volt DC power supply wires to pins 1 (-) and 4 (+) of the J1 or J2 connector, observing the correct polarity. Refer to Figure 2. Firmly tighten down the two slotted screws with a small screwdriver taking care not to overtighten the screws.

Pins 2 and 3 of the J1 and J2 connectors are the RS-485 interface used only for downloading the FirePic from the Detector’s non-volatile memory, or for viewing the Tri-Mode Plot. It is recommended to wire pins 2 and 3 to a separate junction box and properly identify them for future use. A color-coded, multi-connector, shielded, UL-rated cable with 18 to 24-gauge wire is recommended for connecting to J1 or J2. The following color-coding is suggested as a guideline:

<table>
<thead>
<tr>
<th>Pin 1</th>
<th>Pin 2</th>
<th>Pin 3</th>
<th>Pin 4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Black</td>
<td>Green or Blue</td>
<td>White or Yellow</td>
<td>Red</td>
</tr>
<tr>
<td>Ground (-)</td>
<td>RS-485(-)</td>
<td>RS-485(+)</td>
<td>Power (+)</td>
</tr>
</tbody>
</table>

*Fault Relay

*Fault relay is shown in the energized condition during normal operation (No Fault).

Figure 2: Model SS4-A/-A2 Detector Wiring (Bottom View of SS4-A/-A2 Detector Module)

2.2.5 Wiring the SS4-A/-A2 Detector for 4 to 20 mA Current Mode Operation (Optional)

For applications requiring a 4-20 mA analog output, order the optional 4-20 mA Module Assembly, P/N MA420-4, separately or included with the SS4-A/-A2 Detector.

The following analog output levels are available from Detector equipped with the MA420-4 Module:
NORMAL Operation 4 +/- 0.6 mA
ALARM 20 +/- 0.6 mA
FAULT < 0.6 mA

To use the analog output of an SS4-A/-A2, make the following connections:

- 24 V DC J2, pin-4
- 24 V DC RTN J2, pin-1
- 4-20 mA output J5, pin-4 (+)
- 4-20 mA RTN J1, pin-1 (-)

The fire Alarm and fault relays of a Detector equipped with the MA420-4 Module are not usable. However, the Detector's Verify Relay may still be used as a separate Fire Alarm output. Refer to Table 2: “Configuration DIP Switch Settings” to set DIP switches properly.

**NOTE:** J1 is a "loop through" connection to J2. The +24 V supply is connected to J2 pin 4. The red lead connection of the MA420-4 must stay in J1, pin-4. Also, the 8.66 K Ohm supervising resistor (included with each module) **must** be connected at the Fire Alarm relay contacts J4 pin-4 to J4 pin-1, or a Fault condition will occur.

![Figure 3: SS4 Detector Module with MA420-4 Installed (Rear View)]
2.2.6 Wiring the Detector Relays

a. Insert relay cables into the Detector enclosure base through one of the conduit openings. Refer to Figure 6.

b. **Fire Alarm Relay** - Connect wires for Fire Alarm to the appropriate J4 terminals of the Detector. For **Normally Open** relay contacts, install wires into pins 3 and 4 and firmly tighten down the slotted screws with a small screwdriver. The Fire Alarm relay is de-energized during normal operation and will energize when detecting a fire.

c. **Fault Relay** – Connect wires for Fault to the appropriate terminals of the J5 connector. For **Normally Closed** relay contacts, install wires into pins 3 and 4 and firmly tighten down the slotted screws with a small screwdriver. The fault relay is energized during normal operation and with no fault detected, as shown in Figure 2. The fault relay will de-energize when a fault is detected.

2.2.7 Replacing the Detector Module in the Enclosure.

a. Carefully re-install the module over the three metal standoffs and screw it down with the three captive screws to the standoffs.

b. If necessary, clean the Detector’ sensors and windowed cover per instructions of Section 3.2.

c. Securely screw down the metal enclosure top windowed cover and tighten the Allen-head "tamper-proof" screw.

2.3 Enclosure Installation (optional)

2.3.1 Installing the Detector on the Swivel Mount (SM2) or SS Extra Duty (SM4) Swivel Mount

a. Select fasteners for the swivel mounting such that they will secure it to the type of material at the enclosure location.

b. Mount the swivel-mount to the wall assuring correct orientation.

c. Install the mounting bracket onto the Model SS4-A/-A2 Detector enclosure using the #¼-20 or #6 mm screws and nuts provided. If oriented correctly, the outside contours of the mounting ears on the Detector enclosure and the ends of the bracket will match. The large diameter of the threaded insert should face the enclosure.

d. Screw the enclosure/bracket assembly onto the ball or swivel stud. Turn the Detector until the stud bottoms against the enclosure. **Do not tighten.** While holding the enclosure, tighten the jam nut against the bracket.

e. While holding the enclosure, loosen the socket head screw on the SM2 swivel-mount or swivel release bolt on the SM4. Position the enclosure in such a way that the conduit openings are located horizontally at the bottom. Point the enclosure in the desired direction and tighten the appropriate hardware.
Figure 4: Model SM2 Swivel Mount

Figure 5: Model SM4 Stainless Steel Swivel Mount
Figure 6: Model SS4-A/-A2 Detector Enclosure - Side View

Figure 7: Model SS4-A/-A2 Detector Enclosure Rear View
SECTION 3: TROUBLESHOOTING AND MAINTENANCE

3.1 Model SS4-A/-A2 Detector Faults

The Model SS4-A/-A2 Detector issues a Fault (or Trouble) condition by de-energizing its Fault Relay (J5 connector). The following are Detector Faults:

a. **Temperature Fault:** The Detector faults if the internal temperature during operation rises above 80°C or falls below -40°C causing both LEDs to blink rapidly. Corrective action for this type of fault requires factory re-certification.

b. **Excessive Input Voltage Fault:** The Detector faults if the input voltage is too high (greater than 45 Volts) causing both LEDs to blink rapidly. Corrective action for this type of fault requires factory re-certification.

c. **Low Input Voltage Fault:** The Detector faults if the input voltage is too low. The user should check the voltage between Pins 1 and 4 of the power connector J1 or J2. In this case one LED is on until the fault is corrected. If the voltage is below 15 Volts the user should check the wiring and the power supply.

d. **No Power Fault:** The Detector faults if the input voltage is interrupted or turned off causing the absence of LED indication. The user should measure the voltage between Pins 1 and 4 of the power connector J1 or J2. If none or very low voltage is measured, the user should check the wiring and the power supply.

e. **Detector Fault:** The Detector faults if its Optical Sensors fail the automatic built-in “through the lens” test. In this case one LED is on until the fault is corrected. The user should first clean both inside and outside of the lens thoroughly, clean the exposed surface of the Detector sensors and the protective grill mounted on the outside of the housing cover. If the fault has not been eliminated after re-assembly and powering up for 10 to 15 minutes, factory service may be necessary.

f. **Relay Fault:** The Detector faults if one of its Relay circuits fails. In this case one LED is on until the fault is corrected. The user should return the unit to the factory for service.

g. **Self-Checking Fault:** The Detector faults if its internal microprocessor finds a failure during self-checking of the hardware and software. In this case one LED is on until the fault is corrected. This type of fault may be caused by a number of reasons. The user should verify proper grounding of the device and the absence of noise on the power cables. If fault persists the user should return the Detector to the factory for service.

h. **Analog “0” current:** All the above faults will produce an output current loss (0 ± 0.6mA) with the 4-20 mA module option.
3.2 Cleaning Windowed Enclosures and Detectors

The optical window (lens) of the Model SS4-A/-A2 Detector should be cleaned periodically on a regular maintenance schedule. For clean area applications, perhaps monthly cleaning schedule will be sufficient. For extremely contaminated application environments, such as truck filling stations with presence of black carbonaceous smoke, daily cleaning schedule may be necessary.

Clean the window of the Detectors each time they are handled, the windows appear contaminated, fails Built-In-Test, or the Detector fails an end-to-end test with a handheld UV/IR Test Lamp FT-2045 or FT-2145. If necessary, clean the Detector Module Sensors each time the Detector has been disassembled for wiring or replacement.

Use a blast of an air hose or an oil-free cloth to clean the enclosure window. Oil degrades the performance of UV Detectors. Occasionally, the use of a solvent, such as alcohol is acceptable. No disassembly of the Detector is required.

NOTE: The Protective / Self-test grill is an integral part of the Detector, and must not be removed. The attempt to remove this grill voids all warranty.

DO NOT USE SILICONE-BASED OR COMMERCIAL WINDOW CLEANING PRODUCTS. THESE WILL DEGRADE THE MODEL SS4-A/-A2 DETECTOR PERFORMANCE.

WARNING: Potential electrostatic hazard. Do not rub with dry cloth.

3.3 Personnel Training

Troubleshooting of the Model SS4-A/-A2 Detector should be performed only by qualified authorized personnel observing all standard safety practices. Although the Detector operates on safe 24 Volts DC, the FM Approved or UL listed Fire Alarm Panel's power supply may operate on life threatening 120 or 240 Volts AC.

WARNING: Hazardous voltages may be present during testing procedures. Serious injury or death may result due to failure to observe safety precautions.

CAUTION: Model SS4-A/-A2 Detector modules and its components are susceptible to permanent damage due to electrostatic discharge (ESD). Do not handle a module without adequate grounding precautions. If is the Model SS4-A/-A2 Module must shipped back to the factory for repair, it MUST be packed in static protected material. If unavailable, carefully wrap the Module with aluminum foil.
3.4 Detector Repair

Return the defective module to the factory for repair service.

⚠️ There are NO user serviceable parts in a Detector module.

If the Model SS4-A/-A2 Module must be shipped back to the factory for repair, it MUST be packed in static protective material. If not available, the Module should be carefully wrapped with aluminum foil. An RMA (Return Material Authorization) is required for all returns to the factory. Contact Honeywell Analytics Customer Service or your Distributor for an RMA number before shipping a unit back to the factory.

SECTION 5: OPTIONAL ACCESSORIES

5.1 Air Shield for Applications in Contaminated Environment (Part No. DASA1-P)

For installation in areas with high levels of airborne contaminants the Detector Air Shield should be mounted to the Flame Detector housing. The Airline fitting accepts ¼” O.D. nylon tubing for an instrument grade air supply of 5 to 15 psi @ 6 cubic ft. per minute.

5.2 PC Software Kit (2029-INTERFACE-KIT)

PC DOS Software Kit installation facilitates access to FirePic™ and SnapShot™ and provides Detectors operation monitoring capability through the Detector’s RS485 connections. The Kit includes an Interface Box, a PC software diskette, an RS485 and RS232 cables, and a 120 VAC/12 VDC charger. Optional 220 VAC/12 VDC charger is also available upon request.

5.3 4-20 mA Option (MA420-4)

The 4-20 mA module (MA420-4) may be ordered separately or included with all SS4 type Detector orders. Refer to Section 2.2.5 for system wiring details.

5.4 Detector Mounts (SM2 or SM4)

The heavy duty steel Swivel Mount (SM2) or extra duty Stainless Steel Swivel Mount (SM4) may be utilized for mounting the SS4 type Detectors. Refer to Section 2.3 for details.

5.5 Test Lamp (FT-2045 or FT-2145)

This battery powered, portable, explosion-proof handheld test source for remote activation of the SS4 type Detectors simulates the radiant energy emitted by an actual fire in order to test the Detectors operation without the need for an open flame. The unit is rechargeable with a 120VAC / 12VDC charger. Optional 220 VAC/12 VDC charger is also available upon request.

Limited Warranty

Honeywell Analytics warrants its Products against defects in material and workmanship under normal use and service for a period of two (2) years from the date of shipment as described herein. Honeywell Analytics, at its option, will repair or replace, at no charge, such products found to be defective during the warranty period provided that they are returned in accordance with the terms of this warranty. Replaced parts or boards are warranted for the balance of the original applicable warranty period. All Replaced parts of Products shall become the property of Honeywell Analytics. This express limited warranty is extended by Honeywell Analytics to the original purchaser only and is not assignable or transferable to any other party. This is the complete warranty for the Products manufactured by Honeywell Analytics. Honeywell Analytics assumes no obligations or liability for additions or modifications to this warranty unless made in writing and signed by an officer of Honeywell Analytics. Honeywell Analytics does not warrant the installation, maintenance or service of its Products. Honeywell Analytics is not responsible in any way for ancillary equipment not furnished by Honeywell Analytics, which is attached to or used in connection with its Product(s), or for operation of the Product(s) with ancillary equipment and all such equipment if expressly excluded from this warranty. This warranty sets forth the full extent of Honeywell Analytics’ responsibility regarding the Products’ repair or replacement at Honeywell Analytics’ options, is the exclusive remedy. This Warranty is given in lieu of all other Express Warranties, Implied Warranties, including without limitation, Implied Warranties of Merchantability and fitness for a particular purpose, are limited to the duration of this Limited Warranty. In no other event shall Honeywell Analytics be liable for damages in excess of the purchased price of the product(s), for any loss of use, loss of time, inconvenience, commercial loss, lost profits or savings or other incidental, special or consequential damages arising out of or in connection with the use or inability to use such product, to the full extent such may be disclaimed by law.

THIS WARRANTY DOES NOT COVER:

1. Defects or damage resulting from use of the Product(s) in other than its normal and customary manner.
2. Defects or damage from misuse, accident, or neglect.
3. Defects or damage from improper testing, operation, maintenance, installation, alteration, modification or adjustment.
4. Product(s) subject to unauthorized Product modifications, disassemblies or repairs (including, without limitation, the audition of the product of non-Honeywell Analytics supplied equipment) which adversely affect performance of the Product(s) to interfere with Honeywell Analytics’ normal warranty inspection and testing of the Product(s) to verify any warranty claim.
5. Product(s) that have had the serial number removed or made illegible.
6. Freight cost to the repair facility.
7. A Product which due to illegal or unauthorized alteration of the software/firmware in the Product, does not function in accordance with Honeywell Analytics’ specifications.
8. Scratches or other cosmetic damage to Product surfaces that do not affect the operation of the Product.

Laws in the United States and other countries preserve for Honeywell Analytics certain exclusive rights for copyrighted Honeywell Analytics software/firmware, such as the exclusive rights to reproduce in copies and distribute copies of such Honeywell Analytics software/firmware. Honeywell Analytics software/firmware may be used only in the Product(s) in which the software/firmware was originally embodied and such software/firmware in such Product(s) may not be replaced, copied, distributed, modified in any way, or used to produce any derivative thereof. No other use including, without limitation, alteration, modification, reproduction, distribution, or reverse engineering of such Honeywell Analytics software/firmware or exercise or rights in such Honeywell Analytics software/firmware is permitted. No license is granted by implication, estoppel or otherwise under Honeywell Analytics patent rights or copyrights.
